The slope and the $y$-intercept of the line.
$y=-7 x+3$
The Slope Intercept Form of Straight Line Equation: $\quad \mathbf{y}=\mathbf{m x}+\mathbf{c}$
Where:
$\mathrm{m}=$ Slope of the straight line
$\mathrm{c}=$ intercept on y -axis.
The equation given in the question:
$y=-7 x+3$
Converting the given equation in the slope intercept form:
The equation is already in the slope intercept form.
$y=-7 x+3$
Compare the equation with slope intercept equation $y=m x+c$
Therefore,
Slope= -7
Y-intercept= 3

## Second part.

The slope and the $y$-intercept of the line.
$10 x+6 y=-54$
The Slope Intercept Form of Straight Line Equation: $\quad \mathbf{y}=\mathbf{m x}+\mathbf{c}$
Where:
$\mathrm{m}=$ Slope of the straight line
$\mathrm{c}=$ intercept on y -axis.
The equation given in the question:
$10 x+6 y=-54$
Converting the given equation in the slope intercept form:
$6 y=-10 x-54 \quad$ (Tranposing 10x to other side so it becomes negative))
$6 y / 6=-10 / 6 x-54 / \epsilon($ Dividing both sides by 6$)$
$y=-10 / 6 x-9$
Compare the equation with slope intercept equation $\mathrm{y}=\mathrm{mx}+\mathrm{c}$
Therefore,
Slope $=-10 / 6$ or $-5 / 3$
Y-intercept $=\mathbf{- 9}$
